Aggregation of Electricity Supply Plans Fiscal Year 2018

November 2018 Organization for Cross-regional Coordination of Transmission Operators, JAPAN

<INTRODUCTION>

The Organization for Cross-regional Coordination of Transmission Operators, JAPAN (hereafter, the Organization) has aggregated the electricity supply plans for fiscal year (FY) 2018 according to Article 28 of the Operational Rules of the Organization and Article 29 of the Electricity Business Act, which require the plans to be submitted to the Ministry of Economy, Trade and Industry (METI) by electric power companies (EPCOs) under the same article of the Act.

The electricity supply plans are submitted by the EPCOs according to the Network Code of the Organization, aggregated by the Organization, and sent to METI annually by the end of March.

In total, 1,125 electricity supply plans for FY 2018 were aggregated, including 1,124 plans submitted by companies that became EPCOs by the end of December 2017 and one plan submitted by a company that became an EPCO by the end of March 2018.

| Business License | Number |
|---|--------|
| Generation Companies | 642 |
| Retail Companies | 448 |
| Specified Transmission, Distribution and Retail Companies | 19 |
| Specified Transmission and Distribution Companies | 4 |
| Transmission Companies | 2 |
| General Transmission and Distribution Companies | 10 |
| Total | 1,125 |

Number of Electric Power Companies Subject to the Aggregation in FY 2018

1. Electricity Demand Forecast

(1) Actual and Preliminary Data for FY 2017 and Forecast for FY 2018 (Short-term)

a. Peak Demand (average value of the three highest daily loads¹) in August

Table 1-1 shows the actual data for the aggregated peak demand for each regional service area² submitted by the 10 general transmission and distribution (GT&D) companies for FY 2017 and the forecast³ value for FY 2018.

Peak demand (average value of the three highest daily loads) in August 2018 was forecast at 157,870 MW, which represents a 0.5% increase over 157,080 MW in August 2017. In addition, the actual data for FY 2017 were temperature adjusted⁴ to 157,020 MW, and the forecast value for FY 2018 is an increase of 0.5% over the temperature-adjusted value for FY 2017.

Table 1-1 Peak Demand (average value of the three highest daily loads) in August (Nationwide 10^4 kW at the sending end)

| (Nationwide, 10° KW | (at the sending end) |
|---------------------|----------------------|
| FY 2017 | FY 2018 |
| Actual | Forecast |
| 15,708 | 15,787 |
| (15,702) | +0.5% (+0.5%)* |
| | 1 1 |

Value in parentheses is temperature adjusted.

* % change compared with actual data for the previous year

b. Forecast for FY 2018

Table 1-2 shows the monthly average value of the three highest daily loads in FY 2018 from the aggregated peak demand for each regional service area submitted by the 10 GT&D companies. The monthly average value of the three highest daily loads in summer (August) is greater than that in winter (January) by about 10 GW; therefore, nationwide peak demand occurs in summer.

Table 1-2Monthly Peak Demand (average value of the three highest daily loads) in FY 2018
(Nationwide, 104 kW at the sending end)

| | Apr. | May | Jun. | Jul. | Aug. | Sep. |
|-------------|--------|--------|--------|--------|--------|--------|
| Peak Demand | 11,767 | 11,484 | 12,696 | 15,745 | 15,787 | 13,901 |
| | Oct. | Nov. | Dec. | Jan. | Feb. | Mar. |
| Peak Demand | 11,881 | 12,587 | 14,048 | 14,798 | 14,778 | 13,479 |

¹ Peak demand (average value of the three highest daily loads) corresponds to the average value of the three highest daily loads (hourly average) in each month.

² Peak demand in the regional service areas refers to the average value of the three highest daily loads in public demand supplied by retail companies and GT&D companies through the transmission and distribution network of the GT&D companies. The Organization publishes these average values according to the provisions of paragraph 5, Article 23 of the Operational Rules.

³ Demand forecast beyond FY 2018 is based on normal weather. Thus, weather conditions for forecast assumption may vary in contrast to the actual data or estimated value in FY 2017.

⁴ Temperature adjustment is implemented to capture the current demand based on normal weather, which excludes demand fluctuations triggered by air-conditioner operation.

c. Annual Electric Energy Requirements

Table 1-3 shows the preliminary data⁵ for FY 2017 and the forecast value for FY 2018 from the aggregated electric energy requirements of each regional service area submitted by the 10 GT&D companies. The electric energy requirements for FY 2018 are forecast at 888.9 TWh, a 0.4% decrease over 892.6 TWh in the preliminary data for FY 2017. In addition, the preliminary data for FY 2017 were temperature adjusted to 885.4 TWh, and the forecast value for FY 2018 is a 0.4% increase over the temperature-adjusted value in FY 2017.

| (Nationwide, 1 wit at the sending end) | | | | | | |
|--|------------------------------------|--|--|--|--|--|
| FY 2017 | FY 2018 | | | | | |
| Preliminary | Forecast | | | | | |
| 892.6 | 888.9 | | | | | |
| (885.4) | ▲ 0.4% (+0.4%) [*] | | | | | |
| $\mathbf{V}_{\mathbf{r}}$ | . 1 1 | | | | | |

| Table 1-3 Annual Electric Energy Requirements | |
|---|--|
| (Nationwide, TWh at the sending end) | |

Value in parenthesis is temperature adjusted.

* % changes over the preliminary value for the previous year.

⁵ Preliminary data for annual electric energy requirements are an aggregation of the actual data from April to November 2017 with the preliminary data from December 2017 to March 2018.

(2) 10-Year Demand Forecast (Long-term)

Table 1-4 shows the major economic indicators developed and published on November 27, 2017 by the Organization, which are assumptions for the GT&D companies to forecast the peak demand in their regional service areas.

The real gross domestic product $(\text{GDP})^6$ is estimated at \$ 537.7 trillion in FY 2018 and \$581.4 trillion in FY 2027 with annual average growth rates of 0.9%. The index of industrial production $(\text{IIP})^7$ is projected at 105.3 in FY 2018 and 108.2 in FY 2027 with annual average growth rates (AAGR) of 0.3%.

| | FY 2018 | FY 2027 | | |
|----------------------------------|------------------|--------------------------------------|--|--|
| Gross Domestic Product(GDP) | ¥ 537.7 trillion | ¥ 581.4 trillion [0.9%] [*] | | |
| Index of Industrial Product(IIP) | 105.3 | 108.2 [0.3%]* | | |

Table 1-4 Major Economic Indicators Assumed for Demand Forecast

* Average annual growth rate for the forecast value of FY 2018

a. Peak Demand (average value of the three highest daily loads) in August

Table 1-5 shows the peak demand forecast for FY 2018, FY 2022, and FY 2027 as the aggregation of peak demand for each regional service area submitted by the 10 GT&D companies. In addition, Figure 1-1 shows the actual data and the forecast of peak demand from FY 2005 to 2027. The peak demand nationwide is forecast at 157,860 MW in FY 2022 and 157,390 MW in FY 2027, with AAGR of -0.0% from FY 2018 to FY 2027.

The peak demand forecast over 10 years shows a slightly decreasing trend, which is largely due to negative factors, such as efforts to reduce electricity use, wider utilization of energysaving electric appliances, a shrinking population, and load-leveling measures, and despite positive factors such as the expansion of economic scale and greater dissemination of electric appliances.

In addition, the AAGR forecast is lower than that of the previous year, mainly due to a declining level of economic activity and a decreasing trend in actual electricity demand because of progress in energy conservation.

Table 1-5 Peak Demand Forecast (average value of the three highest daily loads) for August (Nationwide, 10⁴ kW at the sending end)

| | | 8 / | | |
|--------------------------|-----------------------------|-----------------|--|--|
| FY 2018 [aforementioned] | FY 2022 | FY 2027 | | |

⁷ Index value in CY 2010 = 100

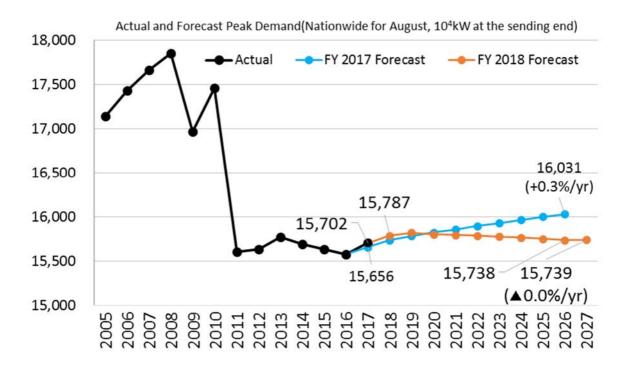

Figure 1-1 Actual and Forecast Peak Demand (Nationwide for August, 10⁴ kW at the sending end)

b. Annual Electric Energy Requirement

Table 1-6 shows the forecast for annual electric energy requirements in FY 2018, FY 2022, and FY 2027 as the aggregation of the electric energy requirements for each regional service area submitted by the 10 GT&D companies. The nationwide annual electric energy requirement is forecast at 889.7 TWh in FY 2022 and 888.2 TWh in FY 2027, with an AAGR of 0.0% from FY 2018 to FY 2027.

The annual electric energy requirement forecast over 10 years shows a slightly decreasing trend, which is largely due to negative factors, such as efforts to reduce electricity use, wider utilization of energy-saving electric appliances, and a shrinking population, and despite positive factors such as expansion of economic scale and greater dissemination of electric appliances.

Table 1-6 Annual Electric Energy Requirement Forecast (Nationwide, TWh at the sending end)

| 8,889 | 8,897 [+0.0%]* | 8,882 [-0.0%]* |

* Average annual growth rate for the forecast value of FY 2018.

2. Electricity Supply and Demand

(1) Supply–Demand Balance Evaluation Method

The Organization will evaluate the supply-demand balance for each regional service area as well as nationwide using the supply capacity⁸ and peak demand data for the regional service areas. Based on the discussion at the 26th meeting of the Study Committee on Regulating and Marginal Supply Capability and Long-Term Supply-Demand Balance Evaluation (March 22, 2018), the Organization will implement its evaluation using the criterion of whether the reserve margin (%)⁹ for each regional service area is secured over 8% or not, and when the least reserve margin emerges at the time other than the average value of the three highest daily loads, the least reserve margin also is secured over 8%.

In the Okinawa EPCO, the criterion is to secure power supply capacity over peak demand against an interruption of its largest generating unit and balancing capacity with frequency control function in its regional service area.

Figure 2-1 summarizes the supply-demand balance evaluation. Supply capacity includes the generating capacity requirements secured by retail and GT&D companies for their regional service areas and the production of surplus power¹⁰ of generation companies. The supply capacity currently secured by retail companies includes power procured from other regional service areas through cross-regional interconnection lines. Thus, the surplus power of generation companies or reserve capacity of retail companies might provide supply capacity for other regional service areas in the future.

Under the circumstances in which the operation of a nuclear power plant has become uncertain, the supply capacity of the corresponding unit or plant is recorded as zero where the corresponding supply capacity is reported as "uncertain" according to Procedures for Electricity Supply Plans of FY 2018 (published in December 2017 by the Agency for Natural Resources and Energy). In the electricity supply plans for FY 2018, supply capacity was reported as "uncertain" by all nuclear power plants except for those that had resumed operation by the time of the submittal of the electricity supply plans (March 1, 2018).

⁸ Supply capacity is the maximum power that can be generated steadily during the peak demand period (average value of the three highest daily loads).

⁹ Reserve margin (%) describes the difference between supply capacity and peak demand (average value of the three highest daily loads) divided by peak demand (average value of the three highest daily loads).

¹⁰ Surplus power is the surplus power generation capacity of generation companies in a regional service area without sales destination.

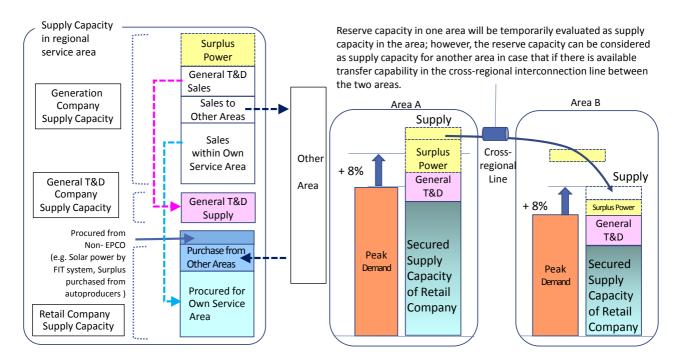

Figure 2-1 Summary of Supply–Demand Balance Evaluation

(2) Actual Data for FY 2017 and Projection for FY 2018 (Short-term)

a. Actual Data for FY 2017

Table 2-1 shows the actual supply-demand balance in August 2017 based on the nationwide supply capacity and peak demand data.

| (Nationwide, 104 kW at the sending end) | | | | | | | | | |
|--|-----------------|---------------------|-------------------|--|--|--|--|--|--|
| Peak Demand (temperature adjusted) [aforementioned] | Supply Capacity | Reserve Capacity | Reserve Margin | | | | | | |
| 15,702 | 18,520 | 2,818 | 17.9% | | | | | | |

Table 2-1 Actual Supply–demand Balance in August 2017 (Nationwide, 104 kW at the sending end)

A reserve margin of 8%, which is the criterion for stable supply, was secured in all regional service areas supplied by GT&D companies.

b. Projection of Supply-Demand Balance in FY 2018

Table 2-2 and Figure 2-2 show the projection of a monthly supply-demand balance (at the time of the least reserve margin) for FY 2018. A reserve margin of 8% is secured for each month nationwide.

| (At the time of the least reserve margin, nation whee, 10° k w at the scheming end) | | | | | | | | |
|---|----------|--------|--------|--------|--------|--------|--|--|
| | Apr. May | | Jun. | Jul. | Aug. | Sep. | | |
| Peak Demand | 11,767 | 11,430 | 12,580 | 15,541 | 15,574 | 13,791 | | |
| Supply Capacity | 14,317 | 14,216 | 15,093 | 17,153 | 17,086 | 16,312 | | |
| Reserve Margin | 21.7% | 24.4% | 20.0% | 10.4% | 9.7% | 18.3% | | |
| | Oct. | Nov. | Dec. | Jan. | Feb. | Mar. | | |
| Peak Demand | 11,859 | 12,578 | 14,049 | 14,798 | 14,778 | 13,480 | | |
| Supply Capacity | 14,540 | 15,000 | 16,214 | 16,820 | 16,777 | 16,081 | | |
| Reserve Margin | 22.6% | 19.3% | 15.4% | 13.7% | 13.5% | 19.3% | | |

Table 2-2 Projection of the Monthly Supply–demand Balance for FY 2018 (At the time of the least reserve margin; nationwide, 10^4 kW at the sending end)

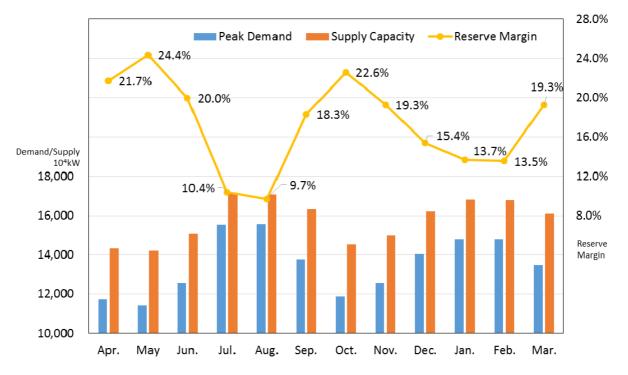

Figure 2-2 Projection of the Monthly Supply–demand Balance for FY 2018 (At the time of the least reserve margin; nationwide, at the sending end)

Table 2-3 shows the monthly projection of the least reserve margin for each regional service area. In addition, Table 2-4 shows the monthly projection of the least reserve margin¹¹ for each regional service area recalculated using power exchanges to areas below the 8% reserve margin from areas of over 8% reserve margin based on the available transfer capability (ATC)¹².

The least reserve margin for each regional service area almost secures the criterion of a stable supply, with a reserve margin of 8%, except for some areas and months. However, a nationwide reserve margin of 8% (the criterion of stable supply) is secured by using cross-regional interconnection lines to share power from other areas with sufficient supply capacity.

Table 2-3 Monthly Projection of the Least Reserve Margins Nationwide and for Each Regional Service Area (Resources within own service area only, at the sending end)

| Nationwide | 21.7% | 24.4% | 20.0% | 10.4% | 9.7% | 18.3% | 22.6% | 19.3% | 15.4% | 13.7% | 13.5% | 19.3% |

Improved to over 8%

¹¹ This evaluation is implemented based on the following. The evaluation of timing of utilization of interconnection lines varies in the regional service areas; power exchange availability is calculated based on the least reserve margin, and the calculated results are less than those based on the reserve margin of a given time. Therefore, this evaluation covers a more severe condition, which is better for a stable supply.

¹² The projection of the reserve margin is based on the ATC of transactions among areas indicated in the electricity supply plan.

In the Okinawa EPCO regional service area,¹³ which is a small and isolated island system unable to receive power through interconnection lines, the criterion of stable supply is to secure supply capacity over peak demand by deducting the capacity of the largest generating unit and balancing this capacity with frequency control ('Generator I', total of 301 MW), without applying the criteria of other interconnected areas. Table 2-5 shows the monthly reserve margin against the deduction of the capacity of Generator I, which indicates the stable supply secured in each month.

| | Table 2-5 Monthly Reserve Margin against the Deduction of the Capacity of Generator 1 (At the sending end) | | | | | | | | | | | | |
|---|--|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| ſ | | Apr. | May | Jun. | Jul. | Aug. | Sep. | Oct. | Nov. | Dec. | Jan. | Feb. | Mar. |
| [| Okinawa | 27.8% | 18.5% | 14.1% | 16.3% | 15.7% | 18.1% | 18.5% | 20.9% | 22.5% | 28.8% | 38.8% | 30.1% |

Table 2-5 Monthly Reserve Margin against the Deduction of the Capacity of Generator I (At the sending end)

¹³ In the Okinawa EPCO regional service area, the evaluation includes the reserve margins of several isolated islands.

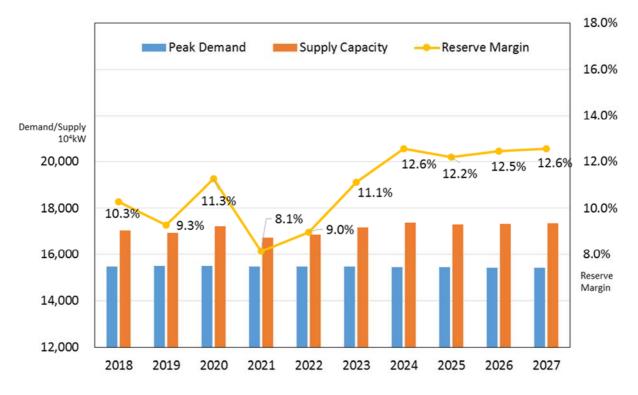

(3) Projection of Supply–Demand Balance for 10 years (Long-term)

a. Supply–Demand Balance

Table 2-6 and Figure 2-3 show the annual supply-demand balance projection for a 10-year period. A reserve margin of 8% is secured each year nationwide.

Table 2-6 Annual Supply–Demand Balance Projection from FY 2018 to 2027 (Nationwide at 17:00 in August, 10⁴ kW at the sending end)

The hours with the least reserve margins vary; for example, 15:00 in the areas of Tokyo, Hokuriku, and Shikoku, 17:00 in the areas of Hokkaido, Tohoku, Chubu, Kansai, and Chugoku, 19:00 in the Kyushu area, and 20:00 in Okinawa. Among those, the reserve margins at 15:00, 19:00, and 20:00 include some areas and months that cannot achieve the criterion of a stable supply, i.e., a reserve margin of 8%. However, the criterion of a stable supply is projected to be secured in all areas and years by sharing power from other areas with sufficient supply capacity through cross-regional interconnection lines (see 7. Findings and Current Challenges (4)).

Table 2-7 shows the annual projection of reserve margins at 17:00 in August judged as the most severe supply-demand balance for each regional service area from FY 2018 to 2027. Table 2-8 shows these projections recalculated by adding power exchanges for the year and areas of below 8% reserve margin even with additional generated surplus from areas of over 8% reserve margin based on ATC.

The evaluation shows that the reserve margin will fall below 8% as follows: in the Tokyo EPCO regional service area in FY 2018–2022 (except in 2020); in the Chubu EPCO area in FY 2019–2021 and 2023–2027; in the Kansai EPCO area in FY 2021, 2022, and 2025–2027; in the Shikoku area in FY 2019, 2021, and 2022; and in the Kyushu area in FY 2018–2021. However, all areas will be projected to secure more than 8% reserve margin required for a stable supply by sharing power from other areas with sufficient supply capacity through cross-regional interconnection lines during the projected period except FY 2021.

Table 2-8 Annual Projection of Reserve Margins for Each Regional Service Area [At 17:00 in August] (With additional surplus power and power exchanges through cross-regional interconnection lines, at the sending end)

Below 8% Criteria

Improved above Criteria

For FY 2021, the stable supply criterion of 8% reserve margin cannot be achieved for the major part of the country at 7.2% even utilizing the ATC of the interconnection lines and sufficient capacity of other areas. However, the Organization did not count newly developing facilities at EPCOs that are not obliged to submit development plans or at EPCOs that are obliged to submit plans, but have not reported such plans. Therefore, the Organization has investigated generating facilities that are not included in the electricity supply plans, although they were already applied to generator connection to GT&D companies and submitted construction plans according to the provisions of Article 48 of the Electricity Business Act in cooperation with the Government.

As a result, there are 1,050 MW of such generating facilities nationwide; thus, the Organization includes those facilities to supply capacity and recalculates reserve margins as outlined in Table 2-9. However, even with this procedure, the reserve margins below 8% only rise to 7.9%, i.e., slightly below the criterion of stable supply.

| | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 | 2027 |

Below 8% Criteria

[Referential Review]

Adding Supply Capacity of Generating Facilities Not Included in the Electricity Supply Plans

As noted, the reserve margins in FY 2021 could not achieve the 8% criterion of stable supply. The Organization has implemented hearings with the EPCOs and recognized that there are some generating facilities that were planned to be shut down, but which would be capable of generation in FY 2021 and which are not included in the electricity supply plans (hereafter referred to as "rapid power-generatable facilities"¹⁴). Figure 2-4 shows projections of discontinuance or retirement of thermal power plants in the mid-to-long term.

The current plan indicates that such generating facilities total about 3,300 MW. Therefore, the Organization reevaluates the reserve margins with such additional supply capacity of 100 MW each in both 50 Hz and 60 Hz areas (200 MW nationwide). The result is shown in Table 2-10, and indicates that reserve margins in FY 2021 exceed 8% nationally.

Figure 2-4 Mid-to-long-term Projections of Discontinuance or Retirement of Thermal Power Plants

¹⁴ A generating facility that is planned to be shut down, but which resumes its generation within about 6 months in case of necessity.

Table 2-10 Annual Projection of Reserve Margins for Each Regional Service Area [At 17:00 in August] (With additional surplus power, power exchanges through cross-regional interconnection lines, and generating facilities not included in the electricity supply plans, and rapid power-generatable facilities at the sending end)

| Tohoku | 12.1% | 12.0% | 10.9% | 9.1% | 9.8% | 10.2% | 11.7% | 11.8% | 13.4% | 15.0% |

b. Conclusion of Supply-Demand Balance Evaluation

Supply-demand Balance Evaluation for FY 2018 (short term): The criterion of stable supply (i.e., 8% of reserve margin) is secured throughout the areas and for the short-term period.

Supply-demand Balance Evaluation for FY 2019–2027 (mid-to-long term): As noted, the criterion of stable supply cannot be secured in many regional service areas at 17:00 in August in 2021. Under the circumstances in which the reserve margin follows a downward trend, the Organization has practical concerns that the reserve margins will fall sharply below the 8% level and lead to power shortages before FY 2024, when the launch of the capacity market is planned to secure supply capacity.

However, the majority of nuclear power plants are reported with supply capacity as zero, including four units projected to resume their operation during the first half of 2018. When the mid-to-long-term supply-demand balances are evaluated, the resumption of operation of nuclear power plants needs to be considered.

Moreover, it is recognized that there are some generating facilities that are planned to be shut down but which are capable of generation in a relatively short period ("rapid power-generatable facilities")

Thus, the Organization continuously and carefully evaluates the mid-to-long-term supplydemand balance; the new plan to restart some nuclear power plants will change the situation, and the accompanying supply-demand balance. The Organization will review safeguard measures for generation procurement in case of necessity.

c. Supply Capacity Secured by Retail Companies According to Their Demand

Table 2-14 and Figure 2-5 show the supply capacity secured by retail companies according to their demand for the 10-year period FY 2018–2027. Particularly in the mid-to-long term, retail companies have planned their supply capacity as "unspecified procurement¹⁵".

| | (| 5.00 mriugust, 10 | 8 | , | |
|----------------------------|---------|-------------------|---------|---------|---------|
| | FY 2018 | FY 2019 | FY 2020 | FY 2021 | FY 2022 |
| Peak Demand Nationwide | 15,787 | 15,819 | 15,801 | 15,794 | 15,786 |
| Secured Supply Capacity | 15,620 | 15,552 | 15,466 | 14,715 | 14,680 |
| Ratio [*] | 98.9% | 98.3% | 97.9% | 93.2% | 93.0% |
| | FY 2023 | FY 2024 | FY 2025 | FY 2026 | FY 2027 |
| Peak Demand Nationwide | 15,776 | 15,764 | 15,751 | 15,738 | 15,739 |
| Secured Supply Capacity | 14,586 | 14,242 | 14,207 | 12,236 | 12,179 |
| Ratio [*] | 92.5% | 90.3% | 90.2% | 77.8% | 77.4% |

Table 2-14 Supply Capacity Secured by Retail Companies According to Their Demand for the 10-year Period FY 2018–2027 (At 15:00 in August; 10⁴ kW at the sending end)

Note: * denotes the ratio of peak demand nationwide to the secured supply capacity.

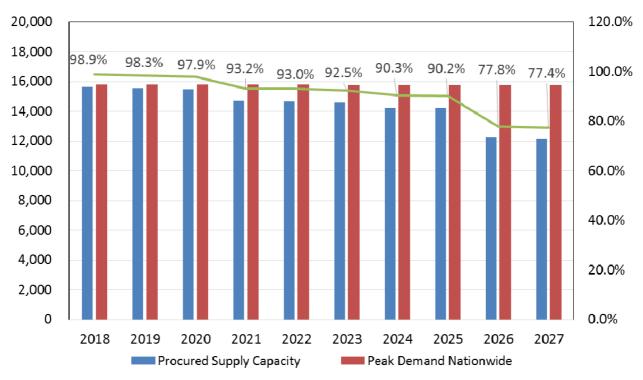

Figure 2-5 Supply Capacity Procured by Retail Companies According to Their Demand for the 10-year Period FY 2018–2027 (At 15:00 in August; at the sending end)

¹⁵ "Unspecified procurement" means that retail companies plan to procure their future supply capacity by means of various procurement choices, including procurement from the market, as described in the format of the electricity supply plan.

d. Supply Capacity Secured by General Transmission and Distribution Companies

GT&D companies secure their supply capacity for the demand of isolated island areas throughout the projected period, and also secure a balancing capacity equivalent to 7%¹⁶ over their peak demand in their regional service areas for FY 2018 by public solicitation. Table 2-15 shows the secured balancing capacity procured by GT&D companies.

| | | | | | | | - | - | | |
|-----------|----------|--------|-------|-------|----------|--------|---------|---------|--------|---------|
| | Hokkaido | Tohoku | Tokyo | Chubu | Hokuriku | Kansai | Chugoku | Shikoku | Kyushu | Okinawa |
| Balancing | 7.2% | 6.8% | 7.5% | 6.9% | 7.0% | 6.9% | 7.1% | 7.2% | 7.0% | 20.5% |
| Capacity | | | | | | | | | | |

Table 2-15 Secured Balancing Capacity¹⁷ Procured by GT&D Companies

¹⁶ Public solicitation of balancing capacity is implemented so as to secure a balancing capacity equivalent to 7% over their peak demand in their regional service areas, and its procurement is based on the peak demand of the second projected year of the previous electric supply plan. Therefore, the procured balancing capacity may be lower than the capacity equivalent to 7% over their peak demand of the current year.

¹⁷The capacity is the ratio of the balancing capacity to the peak demand in the regional service areas of GT&D companies. The ratios for the Hokkaido and Tohoku EPCO areas are in January, and in August for the other areas.

3. Analysis of the Transition of Power Generation Sources

(1) Transition of Power Generation Sources (Capacity)

The installed power generation capacity is the aggregation of the capacity of electric power plants owned by EPCOs and those owned by companies other than EPCOs that are registered as the procured supply capacity of retail and GT&D companies.

Table 3-1 and Figure 3-1 show the transition of installed power generation capacity by power generation sources. Figure 3-2 shows the composition of the transition of installed power generation capacities.

Solar power will notably increase its capacity. Coal- and LNG-fired capacities are also projected to increase, although they may temporarily decrease through replacement according to future power development plans for thermal generation. Oil-fired capacity is projected to decrease through retirement.

Table 3-1 Composition of the Transition of Installed Power Generation Capacities by Power Generation Sources¹⁸ (Nationwide, 10⁴ kW)

¹⁸ The installed power generation capacity is the sum of the values submitted by EPCOs.

¹⁹ The category 'Oil and others' includes the total installed capacities from oil, LPG, and other gas and bituminous mixture fired capacities.

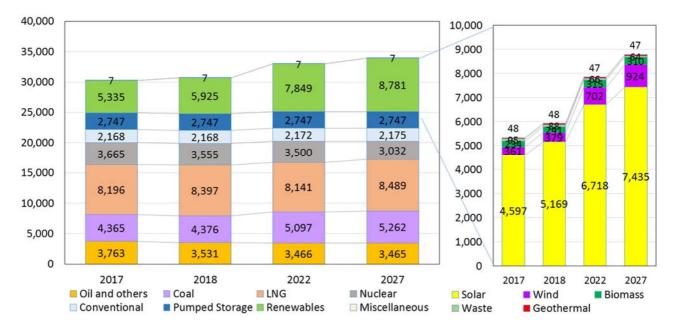

Figure 3-1 Transition of Installed Power Generation Capacities by Power Generation Sources (Nationwide)

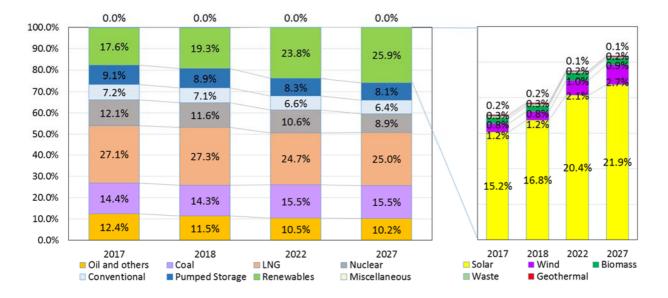

Figure 3-2 Composition of the Transition of Installed Power Generation Capacities by Power Generation Sources (Nationwide)

(2) Transition of Gross Electric Energy Generation

Table 3-2 and Figure 3-3 show the transition of gross electric energy generation by power generation sources aggregated with the reported values submitted by generation companies and those procured by retail and GT&D companies from companies other than EPCOs. Figure 3-4 shows the composition of the transition of gross electric energy generation.

For nuclear power plants, energy generation is calculated as zero for their capacity reported as "uncertain," however, changes to the composition of gross electric energy generation may alter according to the operating conditions of nuclear power plants.

Electricity generated by renewable energy such as solar power will notably increase. Electricity generated by coal is projected to remain at a certain level according to future power development plans for thermal generation. Electricity generated by LNG is projected to decrease sharply.

 Table 3-2 Composition of the Transition of Gross Electric Energy Generation by Power Generation Sources (Nationwide, 10⁸ kWh at the generating end)

²⁰ Unspecified means shortage that is calculated from the balance between the electric energy generated converting the peak demand of a regional service area (nationwide, at the sending end) and the addition of electric energy generated by the type of power generation source.

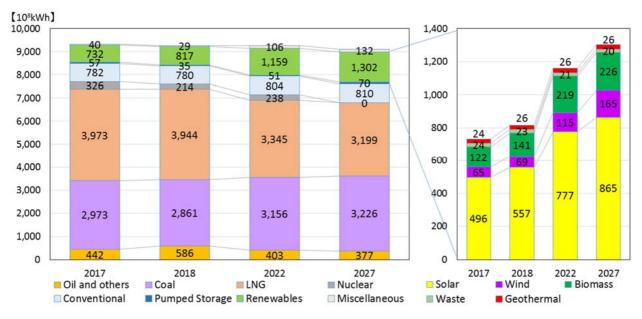

Figure 3-3 Transition of Electric Energy Generation by Power Generation Sources (Nationwide)

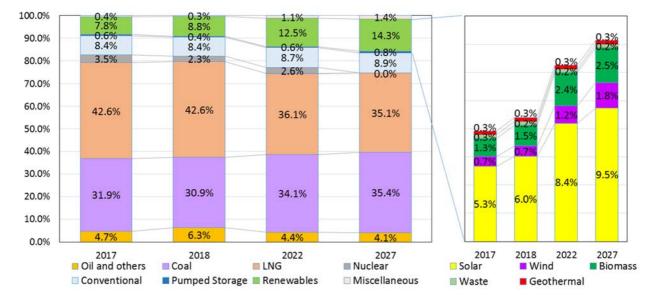

Figure 3-4 Transition of Electric Energy Generation Composition by Power Generation Sources (Nationwide)

(3) Transition of Capacity Factor by Power Generation Sources

Table 3-3 and Figure 3-5 show the capacity factor by power generation sources. The projection of the capacity factor is calculated using the aforementioned power generation sources and gross electric energy generation data provided by the Organization.

According to future power development plans, the installed power generation capacity for thermal generation is projected to increase. However, this does not mean an increase in thermal generation, as the power supply from renewable energy is projected to increase; therefore, the capacity factor of thermal power plants is projected to decrease gradually.

For nuclear power generation, the installed power generation capacity contains that which is specified as uncertain and the capacity factor appears lower; therefore, this projection does not necessarily indicate the real capacity factor for nuclear power plants actually in operation.

| Power Generation Sources | FY 2017 | FY 2018 | FY 2022 | FY 2027 |
|------------------------------|---------|---------|---------|---------|
| Hydro | 19.5% | 18.9% | 19.8% | 20.4% |
| Conventional | 41.2% | 41.1% | 42.2% | 42.5% |
| Pumped Storage | 2.4% | 1.5% | 2.1% | 2.9% |
| Thermal | 51.7% | 51.7% | 47.2% | 45.1% |
| Coal | 77.8% | 74.6% | 70.7% | 70.0% |
| LNG | 55.3% | 53.6% | 46.9% | 43.0% |
| Oil and others ¹⁹ | 13.4% | 18.9% | 13.3% | 12.4% |
| Nuclear | 10.2% | 6.9% | 7.8% | 0.0% |
| Renewables | 15.7% | 15.7% | 16.9% | 16.9% |
| Wind ²² | 20.6% | 20.9% | 18.8% | 20.4% |
| Solar ²² | 12.3% | 12.3% | 13.2% | 13.3% |
| Geothermal | 56.0% | 61.0% | 63.6% | 63.6% |
| Biomass | 59.6% | 66.8% | 79.3% | 83.1% |
| Waste | 29.4% | 29.9% | 36.6% | 35.5% |
| Miscellaneous | - | - | - | - |

Table 3-3 Capacity Factors by Power Generation Sources (Nationwide)²¹

²¹ The capacity factor of nuclear power appears lower due to the calculation using the supply capacity reported as "uncertain" and does not indicate the real capacity factor for nuclear power plants.

²² The capacity factors of wind and solar do not consider the decrease due to output shedding.

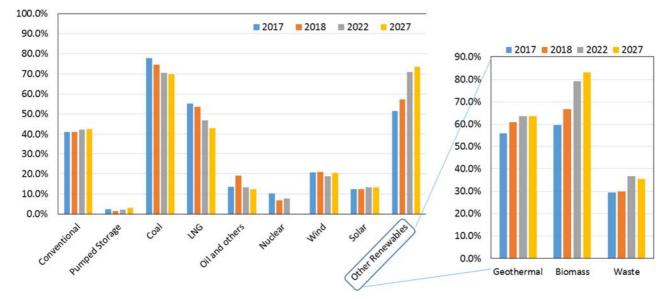

Figure 3-5 Capacity Factor by Power Generation Sources (Nationwide)²¹

(4) Installed Power Generation Capacity and Gross Electric Energy Generation for Each Regional Service Area

Figure 3-6 shows the installed power generation capacity for each regional service area at the end of FY 2017. Figure 3-7 shows the gross electric energy generation for each regional service area at the end of FY 2017.

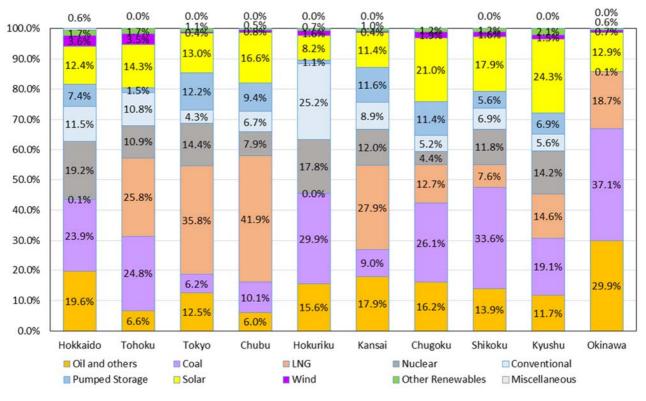

Figure 3-6 Composition of Installed Power Generation Capacity for Each Regional Service Area

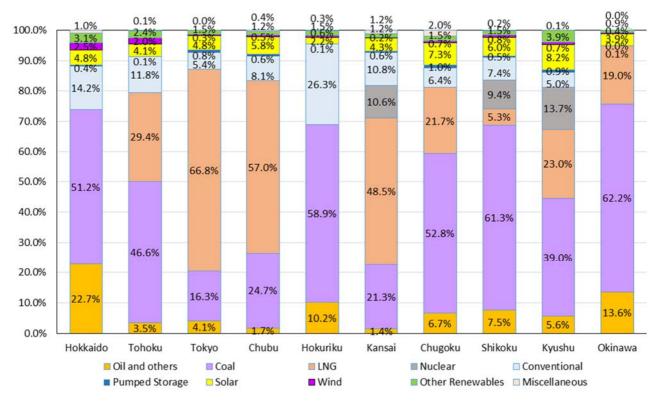

Figure 3-7 Composition of Gross Electric Energy Generation for Each Regional Service Area

(5) Development Plans by Power Generation Sources

Table 3-4 shows the development plans²³ up to FY 2027 submitted by generation companies, according to their new developments, uprating or derating installed facilities, and planned retirement of facilities in the projected period.

Table 3-4 Generation Development Plans up to FY 2027 by Stages (Nationwide, 10⁴ kW)

 $^{^{23}\,}$ Aggregated using facilities for which the date of commercial operation is "uncertain".

4. Development Plans for Transmission and Distribution Facilities

The Organization has aggregated the development plans²⁴ for cross-regional transmission lines and substations (transformers and AC/DC converters) up to FY 2027 submitted by GT&D and transmission companies. Table 4-1 shows the development plans for cross-regional transmission lines and substations. Figure 4-1 shows the outlook for electric systems nationwide. (1), (2), and (3) below list the development plans according to cross-regional transmission lines, major substations, and summaries, respectively.

| Increas | ed Length of Transmission Lines* ^{25*26} | 601 km | |
|---------|---|-------------|--|
| | Overhead Lines* | 572 km | |
| | Underground Lines | 30 km | |
| Uprate | d Capacities of Transformers | 18,020 MVA | |
| Uprate | d Capacities of AC/DC Converters ²⁷ | 2,100 MW | |
| Decrea | sed Length of Transmission Lines | ▲ 50 km | |
| (Retire | ment) | | |
| Derate | d Capacities of Transformers | ▲ 1,600 MVA | |
| (Retire | ment) | | |

Table 4-1 Development Plans for Cross-regional Transmission Lines and Substations

Enhancement plans for cross-regional transmission lines are summarized below.

| Interconnection Facility Enhancement Plan between Hokkaido and Tohoku |
|---|
| (In-service: March 2019) |

| AC/DC Converter Stations | Hokuto Converter Station: 300 MW Imabetsu Converter Station: 300 MW |
|--|---|
| DC Bulk Line 275kV Transmission Lines | Hokuto-Imabetsu DC Bulk Line: 122 km Customer Line AC/DC Converter Station Dπ lead-in:2 km |

²⁴ Development plans for transmission lines and substations are required to be submitted for voltages of more than 250kV, or within two classes of the highest voltage available in the regional service areas. (For the Okinawa EPCO, only 132kV or more is required.) The totals are not necessarily equal due to independent rounding.

²⁵ Development plans corresponding to changes in line category or circuit numbers that were not included in measuring the increased length of transmission lines were treated as no change in the length of transmission lines.

 $^{^{26}}$ Increased length does not include the item with \ast because of an undefined in-service date.

 $^{^{\}rm 27}$ Installed capacity for the converter station on one side is included in the DC transmission system.

Table 4-8 Development Plans for Major Transmission Lines

Table 4-9 Revised Plans for Line Category and the Numbers of Circuits³⁵

| Voltage | Length Extended | Total Extended Length |
|---------|-----------------|-----------------------|
| 500kV | 0 km | 1 km |
| 275kV | 288 km | 486 km |
| 220kV | 9 km | 14 km |
| 187kV | 55 km | 109 km |
| 132kV | 0 km | 0 km |
| DC | 0 km | 0 km |
| Total | 352 km | 610 km |

³² Length denotes both the increased length due to newly installed or extended plans, and the decreased length due to retirement. Development plans corresponding to the change of line category or the number of circuits were not included in the increased length of transmission lines shown in Table 4-8 and are treated as no change in the length. The total lengths are not necessarily equal due to independent rounding.

In addition, the total length is not necessarily equal due to independent rounding.

³³ Total length denotes the aggregation of length multiplied by the number of circuits. Development plans corresponding to the change of line category or the number of circuits were not included in the increased length of transmission lines in Table 4-8 and are treated as no change in the length.

 $^{^{34}\,}$ See footnote 26.

³⁵ Table 4-9 aggregates the extended and total extended lengths corresponding to the revised plans for the line category and the number of circuits.

| | | - | 5 |
|------------------------|-----------------------|----------------------|--------------------|
| Category ³⁶ | Voltage ³⁷ | Increased Numbers | Increased Capacity |
| | 500107 | 13 | 11,950 MVA |
| | 500kV | [5] | [2,000MVA] |
| | | 5 | 3,430 MVA |

| | 500kV | Δ1 | ∆ 1,000 MVA |
| | 275kV | ∆ 2 | △ 600 MVA |
| To be | 220kV | 0 | 0 MVA |
| Retired | 187kV | 0 | 0 MVA |
| | 132kV | 0 | 0 MVA |
| | Total | Δ3 | ∆ 1,600 MVA |

Table 4-10 Development Plans for Major Substations

[]: The aforementioned increase in the number of transformers resulted from new substation installations.

Table 4-11 Development Plans for AC/DC Converter Stations

| Category | Company and Number of Site | S | Capacity ³⁸ |
|-----------------|------------------------------------|---|------------------------|
| | Hokkaido EPCO | 2 | 300MW each |
| Newly | TEPCO Power Grid | 1 | 900MW |
| Installed or | Chubu EDCO | 2 | 900MW |
| Extended | Chubu EPCO | Ζ | 600MW |
| | Electric Power Development Company | 1 | 300MW |

³⁶ Retirement plans with transformer installations are included in Newly Installed or Extended, and negative values are included in the increased numbers or the increased capacity.

³⁷ Voltage class by upstream voltage.

³⁸ Installed capacity of the converter stations on both sides of the DC lines is included.

5. Cross-regional Operation

Retail companies will procure the supply capacity for their customers in their regional service areas. The scheduled procurement from the external service areas at 15:00 in August 2018 is illustrated in four figures. Figures 5-1 and 5-2 show the ratio of the supply capacity and the supply capacity, respectively at 15:00 in August. Figures 5-3 and 5-4 show the ratio of the energy supply and the energy supply, respectively in FY 2018.

Higher ratios for procurement from the external regional service areas are observed in Chugoku, Shikoku and Kansai EPCO areas, and capacity and energy are transmitted to other areas from Tohoku, Shikoku, and Kyushu EPCO areas.

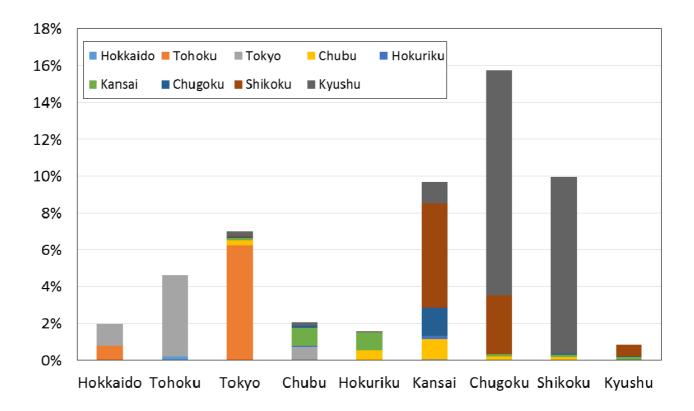

Figure 5-1 Ratio of Scheduled Procurement of Supply Capacity from External Regional Service Areas

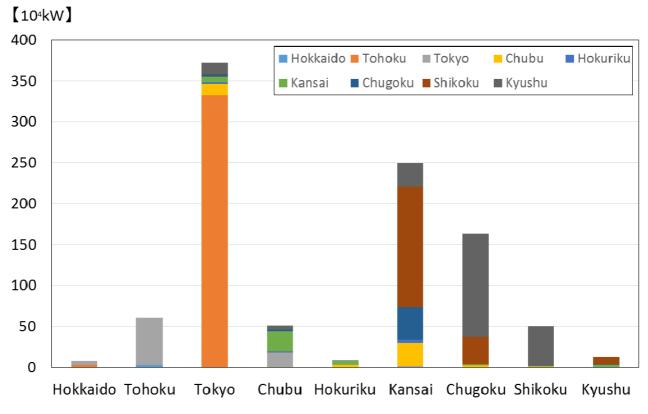

Figure 5-2 Scheduled Procurement of Supply Capacity from External Regional Service Areas

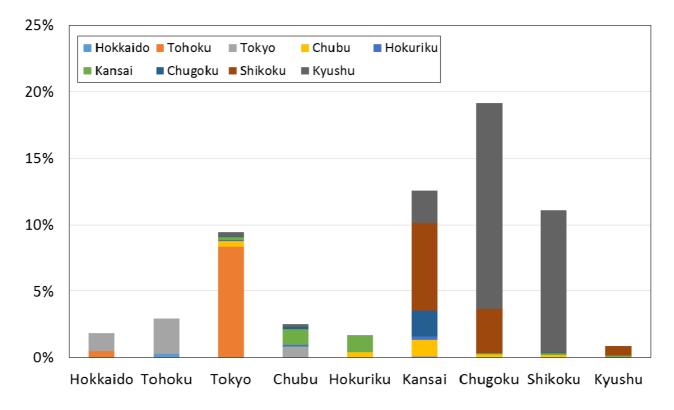

Figure 5-3 Ratio of Scheduled Procurement of Energy Supply from External Regional Service Areas

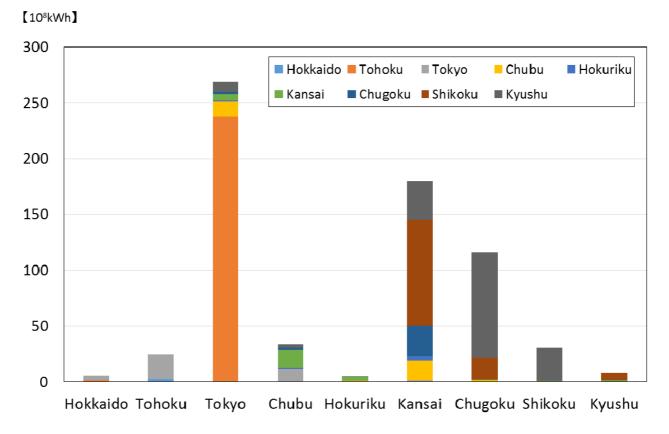

Figure 5-4 Scheduled Procurement of Energy Supply from External Regional Service Areas

6. Analysis of Characteristics of Retail Companies

(1) Distribution of Retail Companies by Business Scale (Retail Demand)

In total, 448 retail companies submitted their electricity supply plans, which have been classified by the business scale of the retail demand forecast by the corresponding companies. Figure 6-1 and 6-2 show the distributions of the business scale of retail demand and the accumulated retail demand forecast by the corresponding companies, respectively. Notably, smaller retail companies plan to expand business.

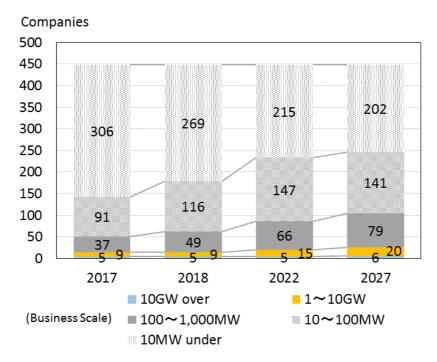

Figure 6-1 Distribution by Business Scale of the Retail Demand by Retail Companies

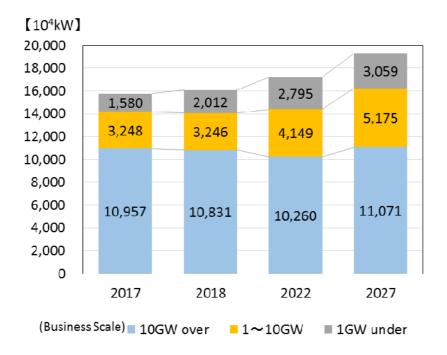

Figure 6-2 Distribution by Accumulated Retail Demand by Retail Companies

Similarly, retail companies are classified by the business scale of the retail energy sales forecast by the corresponding companies. Figure 6-3 and 6-4 show the distributions of the business scale of retail companies' energy sales and their accumulated energy sales forecast, respectively.

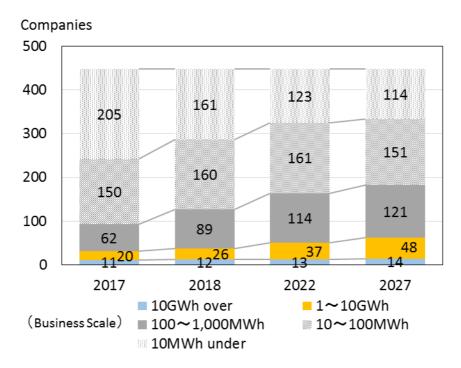

Figure 6-3 Distribution by Business Scale of Retail Companies' Energy Sales

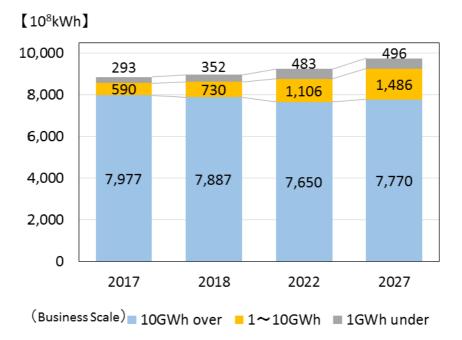

Figure 6-4 Distribution by Retail Companies' Accumulated Energy Sales

(2) Retail Companies' Business Areas

Figure 6-5 shows the ratio of retail companies by the number of areas where they plan to conduct their business. Figure 6-6 shows the number of retail companies by their business planning areas in FY 2018. The figures exclude 39 retail companies that had not yet developed their retail business plans. Half of the retail companies plan their business in a single area.

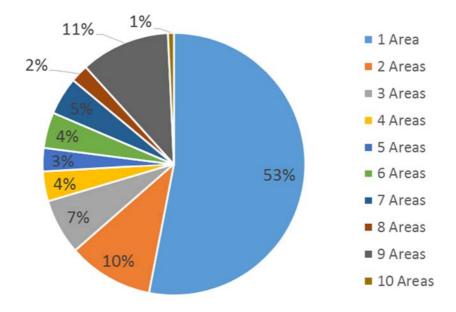

Figure 6-5 Ratio of Retail Companies by the Number of Planned Business Areas in FY 2018

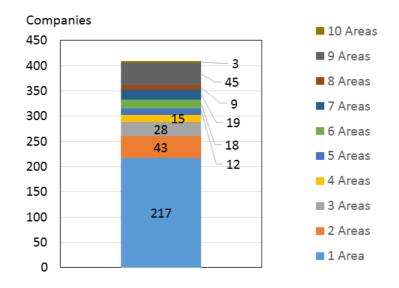

Figure 6-6 Number of Retail Companies by their Business Planning Areas in FY 2018

Figure 6-7 shows the number and the retail demand of retail companies in each regional service areas for GT&D companies in FY 2018. In general, the number of companies is comparable with the scale of retail demand in the regional service area.

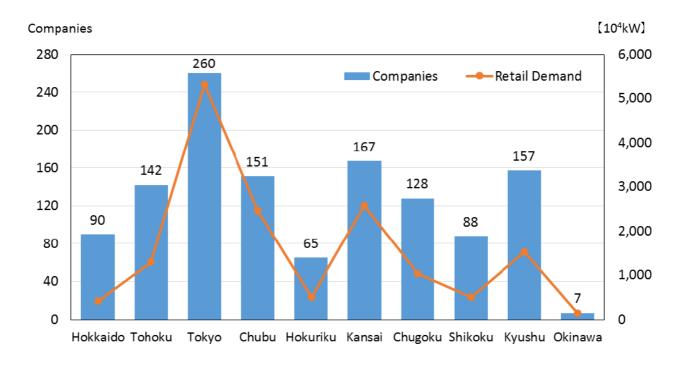

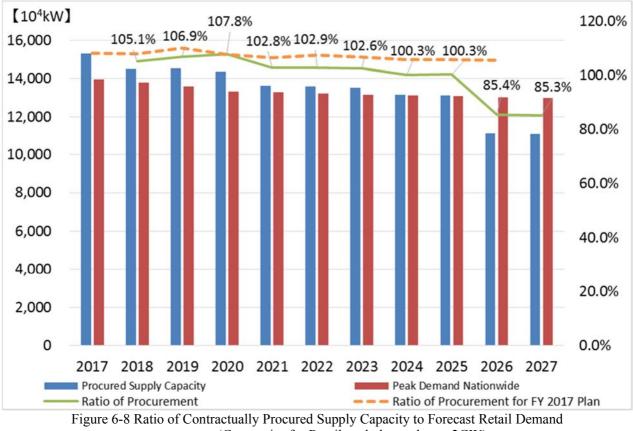

Figure 6-7 Number and Retail Demand of Retail Companies in Each Regional Service Area

(3) Supply Capacity Procurement by Retail Companies

Figures 6-8 and 6-9 show the volume and ratios of the contractually procured supply capacity to the forecast retail demand by the business scale of retail companies, respectively.

Both figures indicate that small and medium-sized retail companies plan their mid-to-long-term supply capacity as "undetermined," which leads to a downward trend in supply capacity procurement.

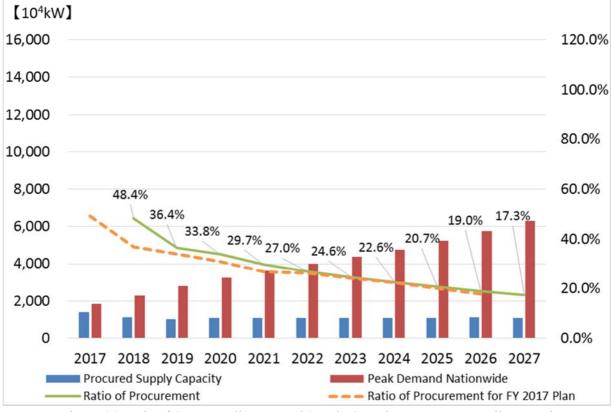

Figure 6-9 Ratio of Contractually Procured Supply Capacity to Forecast Retail Demand (Companies for Retail peak demand under 2GW)

(4) Distribution of Generation Companies by Business Scale (Installed Capacity)

In total, 642 generation companies submitted their electricity supply plans, which have been classified by the business scale of the installed capacity operated by the corresponding companies. Figure 6-10 shows the distribution by business scale and Figure 6-11 shows the installed capacity operated by the corresponding companies.

Generation companies with an installed capacity of under 100 MW are planning to enlarge the scale of their business.

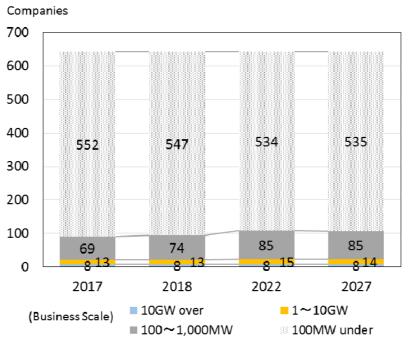

Figure 6-10 Distribution by Business Scale of Generation Companies' Installed Capacity

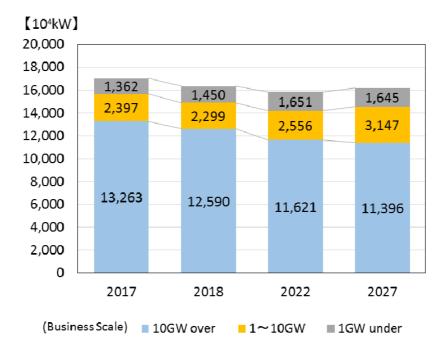

Figure 6-11 Distribution by Generation Companies' Accumulated Installed Capacity

Similarly, generation companies are classified by the business scale of the corresponding companies' energy supply forecast. Figure 6-12 shows the distribution by the business scale of the energy supply and Figure 6-13 shows the distribution by the corresponding companies' accumulated energy supply forecast.

Generation companies with an energy supply of under 1 TWh are planning to enlarge their business scale.

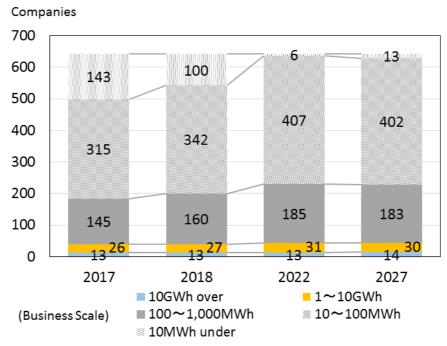

Figure 6-12 Distribution by Business Scale of Generation Companies' Energy Supply

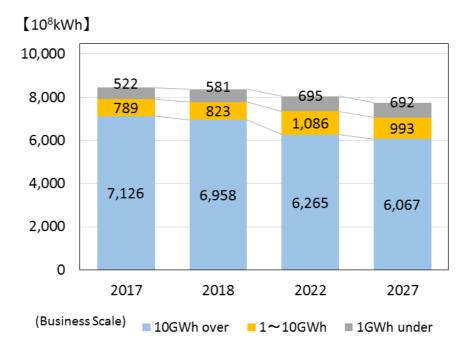

Figure 6-13 Distribution by Generation Companies' Accumulated Energy Supply

(5) Generation Companies' Business Areas

Figure 6-14 shows the ratio of generation companies to the number of areas where they plan to conduct their business. Figure 6-15 shows the number of generation companies by their business planning areas in FY 2018. The figures exclude 106 generation companies that do not own their generation plants. Approximately 75% of all generation companies plan their business in a single area.

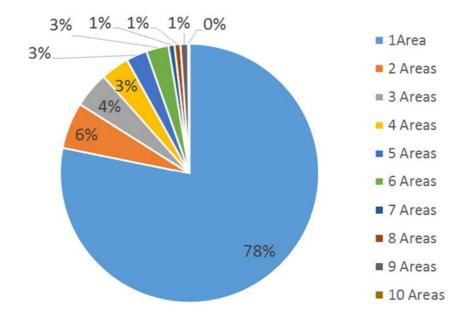

Figure 6-14 Ratio of Generation Companies by the Number of Planned Business Areas in FY 2018

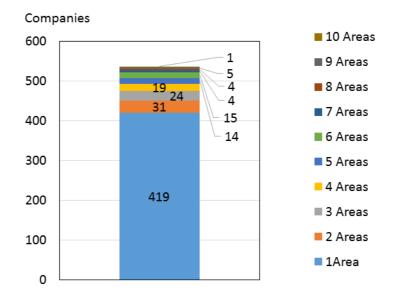

Figure 6-15 Number of Generation Companies by Their Business Planning Areas in FY 2018

Figure 6-16 shows the number and installed capacity of generation companies in each regional service area for GT&D companies in August 2018. In the Hokkaido, Tohoku, Chugoku, Shikoku, and Kyushu regional service areas, the scale of generation companies is rather small and their supply capacity is comparatively small despite the number of generation companies in these regional service areas.

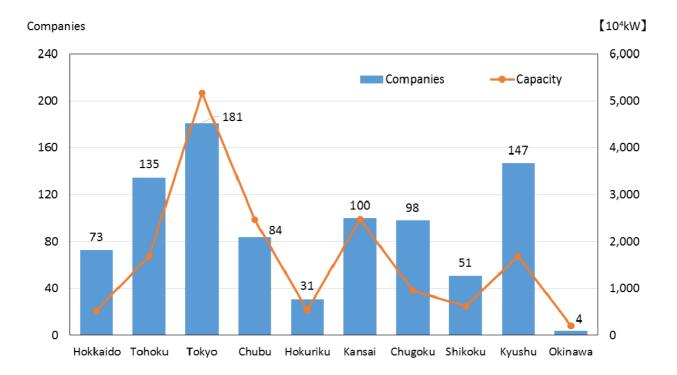

Figure 6-16 Number and Installed Capacity of Generation Companies in Each Regional Service Area

7. Findings and Current Challenges

(1) Electricity Supply Plan Aggregation Findings

After aggregating the electricity supply plans, the Organization identified the following items for the electricity supply plan and the evaluation of supply-demand balances during the aggregation of electricity supply plans under the circumstances that lead to transition of electric power supply: the greater integration of renewable energy, the enlargement of the market with the participation of new players, and the results of some changes to the system.

a. Appropriate State between Aggregation of Electricity Supply Plan and Supply-Demand Evaluation at Electricity Supply-Demand Verification, and Principle of Electricity Supply Plan beyond Capacity Market Introduction

 \cdot Since the East Japan Earthquake, electricity supply-demand verification studies have been conducted to assess supply-demand conditions for the upcoming summer and winter assuming severe weather conditions in addition to the aggregation of electricity supply plans.

•The supply-demand evaluation at Electricity Supply-Demand Verification has been overlapped for purpose and role with electricity supply plans that evaluates supply-demand balance and recognize supply capacity according to demand based on the Electricity Business Act. To improve business efficiency, the Organization will review the purpose and the role of both effort, and assign proper roles to each of them.

 \cdot Further, the introduction of the capacity market has been reviewed as an effective scheme for procuring supply capacity in a secure manner. After its introduction, it is likely that the contents of the electricity supply plan or matters to be reviewed will differ among retail, generation, and GT&D companies. Therefore, the principle of the electricity supply plan will be changed to become a more efficient and effective procedure.

b. Need for the Comprehension of Unreported Supply Capacity

The supply capacity of the EPCOs that are not obliged to submit their supply plans is unknown. Accordingly, the Organization has investigated the submission of construction plans of such unreported power plants and included them in the supply capacity aggregation (see p. 12). Henceforth, improvement of the scheme for supply plans will be reviewed in cooperation with the Government so as to continuously report such unreported supply capacity in the aggregation of the supply plans.

c. Method of Calculating Supply Capacity of Pumped-Storage Hydro Power Plant and Energy Storage Batteries

•The supply capacity of pumped-storage hydro power plants must be properly calculated according to the energy supply expected to pump up water and the water capacity of upper reservoir ponds. The calculation method differs somewhat between GT&D companies. In future, the calculation methods of the supply capacity of pumped-storage hydro power plants must be clarified and unified due to the increasing importance of the function of pumped-storage hydro power plants and the trading of the supply capacity of pumped-storage hydro power plants in the capacity market given greater integration of renewable energy.

 \cdot Similarly, it is likely that more large-scale energy storage batteries will be integrated into the grid to secure balancing capacity apace with the integration of renewable energy. The calculation method of the supply capacity of energy storage batteries must be established in accordance with the possibility of utilizing energy storage batteries as supply capacity.

(2) Current Challenges in the Aggregation of Electricity Supply Plans

a. Need to Secure Stable Supply at the Introduction of a Capacity Market and Beyond

•At the previous aggregation of supply plans, the Organization recognized that the reserve margin of the Tokyo, Chubu, and the Kansai EPCO regional service areas (the three major areas) will fall below the 8% criterion in some projected years. The Organization has analyzed that the decreasing reserve margins are attributable to: (1) the former general electric power companies (retail and generation sectors of the current 10 GT&D companies) have decreased their supply capacity according to the shrinking demand of their area, and (2) in the meanwhile, small and medium-sized retail companies have grown their share of energy sales remaining their supply capacity as "unspecified procurement"

•At this year's aggregation, the Organization recognized that the other areas (particularly, Tohoku, Shikoku, and Kyushu) as well as the three major areas share the same tendency of decreasing reserve margins. This will lead to a fall in the reserve margin under 8% in several areas, even though the leveling of the reserve margin for supply-demand balance is implemented through interconnection lines.

·In addition, the Organization has implemented hearings with the former general electric power companies (retail and generation sector of the GT&D companies), and gathered relevant information to analyze the factors that decrease the supply capacity, such as discontinued operation or retirement of aged thermal power plants.

✓ The retail sector of the former general electric power companies (deemed retail companies) is projecting that if the demand that is supplied by another retail company (i.e. renounced demand) grows at the present pace, renounced demand will achieve 22% equivalent of the regional service area demand nationwide (25% for the three major areas) in FY 2027.

- ✓ Based on the above projection, five deemed retail companies (including the three major areas) have submitted supply plans that indicate that the procured reserve capacity is 1-3% equivalent of the area demand for their supply capacity in the long term. Moreover, they consider that further supply capacity will be procured from their surplus power of the generation company (i.e., the generation sector of the company).
- ✓A Generator regarded as surplus power is a less competitive aged thermal power plant. The relatively low turnover market price of such power plants will decrease further given greater integration of renewable energy. The generation sector of the company projects that such a

generator cannot be maintained if the generation necessary for maintaining surplus power is put on the market at marginal cost.

•On the assumption that these trend rapidly progress, the Organization has practical concerns that the above-stated conditions will lead to power shortages before FY 2024, when the capacity market will be introduced to secure supply capacity. Therefore, the Organization will pay greater attention to future trends of supply capacity and will implement the evaluation of supply-demand balance. In addition, the Organization will proceed with a review of practical measures including institutional measures in cooperation with the Government to ensure a secure supply capacity before the introduction of the capacity market.

 \cdot As part of the review process noted above, the Organization will also address the following issues: (1) retail companies should procure long-term supply capacity of 1–3% equivalent to their projected peak demand; (2) once deemed retail companies have proposed their reserve margin as 5% equivalent to their projected peak demand at the review process, and whether it has integrity with (1); and (3) the principle of supply capacity in the projecting period that the deemed retail companies must essentially procure. If necessary, the Organization will implement countermeasures for these matters.

•In addition, the Organization has stated the need for the introduction of the capacity market at the FY 2017 aggregation of supply plans. Recent circumstances emphasize the need for the capacity market as a scheme to ensure a secure supply capacity in the future. The Organization will proceed with the practical design of the capacity market in continued cooperation with the Government.

b. Need for Supply-demand Balance Evaluation at Maximum Residual Peak Demand Including Winter

•At present, summer peak demand is only assessed for long-term supply-demand balance for the areas that have annual peak demand in the summer (all areas except Hokkaido and Tohoku). In contrast, the 2017 winter was the most severe that Japan has experienced for several decades. The summer peak areas have recorded sharp increases in winter peak demand; Tokyo in particular suffered power shortages and was supplied electricity from other areas.

•The background of power shortages will be analyzed in detail; preliminary analysis has examined the relationship between demand growth and estimation of securing supply capacity and indicates the following factors.

✓ The supply capacity of solar power is likely to exceed the conservatively estimated value $(L5)^{39}$ in summer; however in winter, its supply capacity is likely to be lower due to snowfall, snow cover, or cloudy weather. Forecast error will arise from the derated supply capacity of solar power and the demand growth due to the cold, which will result in the worsening condition of supply-demand.

³⁹ Average of the five lowest actual supply capacities (hourly average) during a given period.

- ✓ Generally, daily demand in the winter increases day by day, which leads to greater daily energy consumption. In turn, this consumes a larger balancing capacity supplied by pumped-storage hydro power plants. The consumed water volume in upper reservoir ponds cannot be restored within a day, meaning that the supply-demand balance for the next day cannot be secured.
- ✓ To exacerbate matters, there is the scheduled maintenance of thermal power plants and the forced outage of generators. Further compromised supply-demand balance occurs from the combination of these conditions.

•To focus on the recent severe winter demand, deducting the portion of demand supplied by solar and wind power (i.e., residual peak demand) from the projected peak demand, all areas other than Kansai and Okinawa have a larger demand in winter than summer. In the winter of 2016, although somewhat milder than last winter, six areas recorded higher actual residual peak demand in winter than in the previous summer. Further, for the recent aggregation of supply plans, projected residual peak demand will be higher in winter than in summer for the areas other than Tokyo, Kansai, and Okinawa (see reference 1).

•Thus, the occurrence of annual peak demand is likely to change from summer to winter for comparison of projected residual peak demand. The Organization will consider reflecting the forecast error⁴⁰ of solar power supply capacity in the winter supply–demand balance evaluation, and the evaluation method of supply capacity of pumped-storage hydro power plants in the review process of mid-to-long-term supply and balancing capacity and coordination of scheduled maintenance work in the short term.

• Further, in the case of possible power shortages as occurred this past winter, the Organization will accurately inform members who are generation companies or retail companies of the conditions with respect to temporary measures in advance of requesting countermeasures such as energy conservation to the public or large customers. The Organization will also review schemes to encourage the adoption of proper countermeasures and the principles of countermeasures against power shortages in cooperation with the Government.

⁴⁰ The improvement in forecast error of solar power supply capacity shall be continuously reviewed by all EPCOs concerned.

<Reference 1> Actual and Projected Residual Peak Demand Comparison between Summer and Winter

Note:

1. Actual average value of the three highest daily loads are processed data from Open Access Same-time Information System of the Organization. (Summer: July to September, Winter: December to February)

2. The projected average values of the three highest daily loads are data submitted from the supply plans (Summer: August, Winter: January).

3. Residual Peak Demand = Average Value of the Three Highest Daily Loads – Supply Capacity of Solar Power – Supply Capacity of Wind Power.

The supply capacity of solar and wind power is calculated as actual data for FY 2016, and projected supply capacity as $L5^{39}$ for FY 2017 and 2018.

c. Securing Mid-to-long-term Balancing Capacity

•The Organization has intensively conducted hearings with GT&D companies on supply- demand balance evaluation during off-peak periods other than traditional supply-demand balance evaluation at the occurrence of peak demand in the aggregation of the FY 2017 supply plans. As a result, there is a possible need in several areas for output shedding of thermal power generation or renewable energy according to the priority dispatch rule of generation with greater integration of renewable energy or lower demand occurrence at off-peak evaluation in FY 2018.

 \cdot Moreover, the Organization has recognized the following factors as being characteristic of supplydemand balance during off-peak periods.

- ✓ Surplus supply capacity in daytime hours is expected to be absorbed by pumping of pumpedstorage hydro power plants, which are unevenly installed across regional service areas.
- ✓ There is increasing need for balancing capacity with a higher ramp speed that can cope with the steep decrease of solar power supply capacity in the evening time on the condition that fewer thermal power plants are integrated for the purpose of balancing. (See Reference 2.)
- ✓ There is an increasing need for balancing capacity as reserve capacity for times when the balancing capacity is activated against severe weather (i.e., Generator Γ^{41} ; demand reduction)

⁴¹ Additionally procured supply capacity with Generator I (i.e., firmly procured generators or contracts that GT&D companies exclusively procure) against severe weather.

other than in peak periods due to the larger forecast error of solar power generation. (See Reference 3.)

 \cdot In view of these varying conditions during off-peak periods due to greater integration of renewable energy and reflecting the forecast error of solar power generation during winter peak period, the Organization has recognized anew the validity in the present procurement of the balancing capacity of Generator I (7% equivalent to peak demand), which has been uniformly set in regional service areas based upon the assumption that the surplus balancing capacity of Generator II⁴² can be abundantly expected.

•In addition, it is important that both the required mid-to-long-term balancing capacity generator and the scheme for procuring balancing capacity with timing, volume, and necessary specification will be secured to utilize renewable energy at most and rationally achieve the security of stable supply and supply-demand balance under the national long-term projections of energy supply and demand. Therefore, the Organization will structure the detailed design of the balancing capacity market as a scheme that can broadly and economically ensure the necessary procurement of balancing capacity in cooperation with the Government and GT&D companies.

⁴² Generators or contracts that share capacity between the supply capacity of retail companies and the balancing capacity of GT&D companies, which are procured as the supply capacity of retail companies; however, any surplus after gate closure is utilized as balancing capacity for any deficiencies or redundancy of GT&D companies.

<Reference 2>Supply-Demand Image during Off-peak Period

Utilization of balancing capacity for redundancy will be maximally needed such as pumping water for pumped [10⁴kW] storage, energy exchange through cross-regional interconnection line, or suppression of thermal power output. 1.200 Water Pumping by Pumped Generation by Generation by Storage Power Plants Pumped Storage 1.000 Pumped Storage **Power Plants** Load Power Plants 800 600 Solar Thermal Power Power 400 200 Hydro Power 0 6:00 18:0C 12:0C 0:00

APPENDIX 2 Long-term Supply–Demand Balance for the 10-year Period FY2018–2027 · · · A3

APPENDIX 1 Supply–Demand Balance for FY 2018

Tables A1-1 to A1-4 show the monthly peak demand, monthly supply capacity, monthly reserve capacity, and reserve margin for each regional service area in FY 2018, respectively. Table A1-5 shows the monthly projection of the reserve margin for each regional service area recalculated with power exchanges to areas below the 8% reserve margin from areas with over 8% reserve margin.

Improved to over 8%

APPENDIX 2 Long-term Supply–Demand Balance for the 10-year Period FY 2018–2027

Tables A2-1 to A2-4 show a 10-year projection of the annual peak demand, annual supply capacity, annual reserve capacity, and reserve margin for each regional service area from FY 2018 to FY 2027, respectively. Table A2-5 shows the annual projection of the reserve margin for each regional service area recalculated with power exchanges from areas with over 8% reserve margin to areas below the 8% reserve margin. Tables A2-6 to A2-10 show a 10-year projection of the annual peak demand, annual supply capacity, annual reserve capacity, and reserve margin for winter peak areas of Hokkaido and Tohoku, respectively.

Opinions for the Minister of Economy, Trade and Industry on the Aggregation of the Electricity Supply Plan

On the aggregation of the electricity supply plan, the Organization sent the results and opinions stated below to the Minister of Economy, Trade and Industry according to the provision of paragraph 2 of Article 29 of the Electricity Business Act .

1. Need to Secure Stable Supply at the Introduction of a Capacity Market and Beyond

At the previous aggregation of supply plans, the Organization recognized that the reserve margin of the Tokyo, Chubu, and the Kansai EPCO regional service areas (the three major areas) will fall below the 8% criterion in some projected years. The Organization has analyzed that the decreasing reserve margins are attributable to: (1) the former general electric power companies (retail and generation sectors of the current 10 GT&D companies) have decreased their supply capacity according to the shrinking demand of their area, and (2) in the meanwhile, small and mediumsized retail companies have grown their share of energy sales remaining their supply capacity as "unspecified procurement"

At this year's aggregation, the Organization recognized that the other areas (particularly, Tohoku, Shikoku, and Kyushu) as well as the three major areas share the same tendency of decreasing reserve margins. This will lead to a fall in the reserve margin under 8% in several areas, even though the leveling of the reserve margin for supply-demand balance is implemented through interconnection lines.

In addition, the Organization has implemented hearings with the former general electric power companies (retail and generation sector of the GT&D companies), and gathered relevant information to analyze the factors that decrease the supply capacity, such as discontinued operation or retirement of aged thermal power plants.

- ✓ The retail sector of the former general electric power companies (deemed retail companies) is projecting that if the demand that is supplied by another retail company (i.e. renounced demand) grows at the present pace, renounced demand will achieve 22% equivalent of the regional service area demand nationwide (25% for the three major areas) in FY 2027.
- ✓ Based on the above projection, five deemed retail companies (including the three major areas) have submitted supply plans that indicate that the procured reserve capacity is 1-3% equivalent of the area demand for their supply capacity in the long term. Moreover, they consider that further supply capacity will be procured from their surplus power of the generation company (i.e., the generation sector of the company).
- ✓ A Generator regarded as surplus power is a less competitive aged thermal power plant. The relatively low turnover market price of such power plants will decrease further given greater

integration of renewable energy. The generation sector of the company projects that such a generator cannot be maintained if the generation necessary for maintaining surplus power is put on the market at marginal cost.

On the assumption that these trend rapidly progress, the Organization has practical concerns that the above-stated conditions will lead to power shortages before FY 2024, when the capacity market will be introduced to secure supply capacity. Therefore, the Organization will pay greater attention to future trends of supply capacity and will implement the evaluation of supply-demand balance. In addition, the Organization will proceed with a review of practical measures including institutional measures in cooperation with the Government to ensure a secure supply capacity before the introduction of the capacity market.

As part of the review process noted above, the Organization will also address the following issues: (1) retail companies should procure long-term supply capacity of 1–3% equivalent to their projected peak demand; (2) once deemed retail companies have proposed their reserve margin as 5% equivalent to their projected peak demand at the review process, and whether it has integrity with (1); and (3) the principle of supply capacity in the projecting period that the deemed retail companies must essentially procure. If necessary, the Organization will implement countermeasures for these matters.

In addition, the Organization has stated the need for the introduction of the capacity market at the FY 2017 aggregation of supply plans. Recent circumstances emphasize the need for the capacity market as a scheme to ensure a secure supply capacity in the future. The Organization will proceed with the practical design of the capacity market in continued cooperation with the Government.

2. Need for Supply–Demand Balance Evaluation at Maximum Residual Peak Demand Including Winter

At present, summer peak demand is only assessed for long-term supply-demand balance for the areas that have annual peak demand in the summer (all areas except Hokkaido and Tohoku). In contrast, the 2017 winter was the most severe that Japan has experienced for several decades. The summer peak areas have recorded sharp increases in winter peak demand; Tokyo in particular suffered power shortages and was supplied electricity from other areas.

The background of power shortages will be analyzed in detail; preliminary analysis has examined the relationship between demand growth and estimation of securing supply capacity and indicates the following factors.

- ✓ The supply capacity of solar power is likely to exceed the conservatively estimated value (L5) in summer; however in winter, its supply capacity is likely to be lower due to snowfall, snow cover, or cloudy weather. Forecast error will arise from the derated supply capacity of solar power and the demand growth due to the cold, which will result in the worsening condition of supply-demand.
- ✓ Generally, daily demand in the winter increases day by day, which leads to greater daily energy consumption. In turn, this consumes a larger balancing capacity supplied by pumped-

storage hydro power plants. The consumed water volume in upper reservoir ponds cannot be restored within a day, meaning that the supply-demand balance for the next day cannot be secured.

✓ To exacerbate matters, there is the scheduled maintenance of thermal power plants and the forced outage of generators. Further compromised supply-demand balance occurs from the combination of these conditions.

To focus on the recent severe winter demand, deducting the portion of demand supplied by solar and wind power (i.e., residual peak demand) from the projected peak demand, all areas other than Kansai and Okinawa have a larger demand in winter than summer. In the winter of 2016, although somewhat milder than last winter, six areas recorded higher actual residual peak demand in winter than in the previous summer. Further, for the recent aggregation of supply plans, projected residual peak demand will be higher in winter than in summer for the areas other than Tokyo, Kansai, and Okinawa.

Thus, the occurrence of annual peak demand is likely to change from summer to winter for comparison of projected residual peak demand. The Organization will consider reflecting the forecast error* of solar power supply capacity in the winter supply-demand balance evaluation, and the evaluation method of supply capacity of pumped-storage hydro power plants in the review process of mid-to-long-term supply and balancing capacity and coordination of scheduled maintenance work in the short term.

Further, in the case of possible power shortages as occurred this past winter, the Organization will accurately inform members who are generation companies or retail companies of the conditions with respect to temporary measures in advance of requesting countermeasures such as energy conservation to the public or large customers. The Organization will also review schemes to encourage the adoption of proper countermeasures and the principles of countermeasures against power shortages in cooperation with the Government.

*Improvement of forecast error of solar power supply capacity shall be continuously reviewed by the all EPCOs concerned.

3. Securing Mid-to-long-term Balancing Capacity

The Organization has intensively conducted hearings with GT&D companies on supply-demand balance evaluation during off-peak periods other than traditional supply-demand balance evaluation at the occurrence of peak demand in the aggregation of the FY 2017 supply plans. As a result, there is a possible need in several areas for output shedding of thermal power generation or renewable energy according to the priority dispatch rule of generation with greater integration of renewable energy or lower demand occurrence at off-peak evaluation in FY 2018.

Moreover, the Organization has recognized the following factors as being characteristic of supply-demand balance during off-peak periods.

✓ Surplus supply capacity in daytime hours is expected to be absorbed by pumping of pumped-

storage hydro power plants, which are unevenly installed across regional service areas.

- ✓ There is an increasing need for balancing capacity with a higher ramp speed that can cope with the steep decrease of solar power supply capacity in the evening time on the condition that fewer thermal power plants are integrated for the purpose of balancing
- ✓ There is an increasing need for balancing capacity as reserve capacity for times when the balancing capacity is activated against severe weather (i.e., Generator I'; demand reduction) other than in peak periods due to the larger forecast error of solar power generation.

In view of these varying conditions during off-peak periods due to greater integration of renewable energy and reflecting the forecast error of solar power generation during winter peak period, the Organization has recognized anew the validity in the present procurement of the balancing capacity of Generator I (7% equivalent to peak demand), which has been uniformly set in regional service areas based upon the assumption that the surplus balancing capacity of Generator II can be abundantly expected.

In addition, it is important that both the required mid-to-long-term balancing capacity generator and the scheme for procuring balancing capacity with timing, volume, and necessary specification will be secured to utilize renewable energy at most and rationally achieve the security of stable supply and supply-demand balance under the national long-term projections of energy supply and demand. Therefore, the Organization will structure the detailed design of the balancing capacity market as a scheme that can broadly and economically ensure the necessary procurement of balancing capacity in cooperation with the Government and GT&D companies.
